

Une approche convexe de la super-résolution et de la régularisation de lignes 2D dans les images

Kévin Polisano, Laurent Condat, Marianne Clausel, Valérie Perrier

Université Grenoble Alpes, Laboratoire Jean Kuntzmann

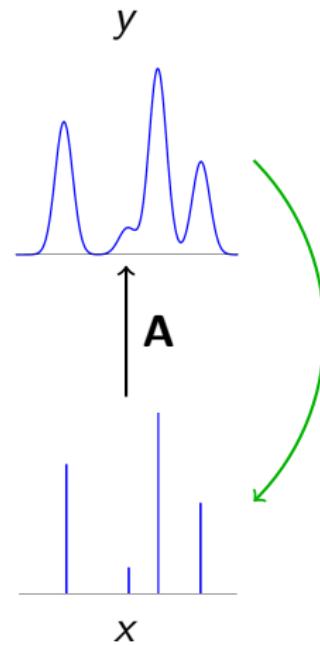

Super-resolution of 1-D impulses

$$x(t) = \sum_{k=1}^K c_k \delta_{t_k}, \quad c_k \geq 0, \quad t_k \geq 0$$

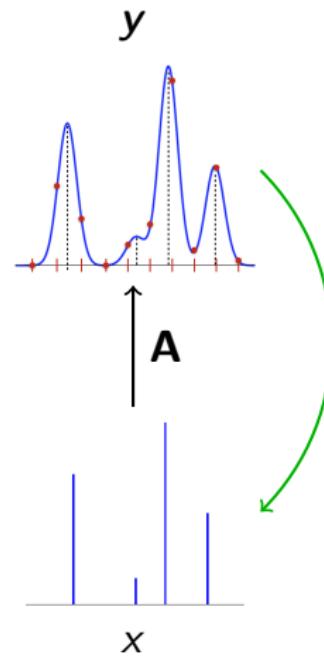

$$y(t) = \sum_{k=1}^K c_k h(t - t_k)$$

Sparse ℓ_0 deconvolution on a grid

$$\min_{\mathbf{c} \in \mathbb{R}^K} \frac{1}{2} \|\mathbf{y} - \mathbf{Ac}\|_2^2 + \lambda \|\mathbf{c}\|_0$$

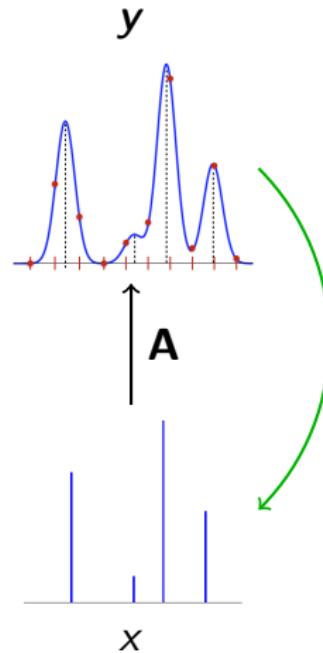

$$\mathbf{y} = y(\tau_i), \quad \tau_i = i\Delta/N \longrightarrow \tilde{x}_i$$

Sparse ℓ_1 deconvolution on a grid (LASSO)

$$\min_{\mathbf{c} \in \mathbb{R}^K} \frac{1}{2} \|\mathbf{y} - \mathbf{Ac}\|_2^2 + \lambda \|\mathbf{c}\|_1$$

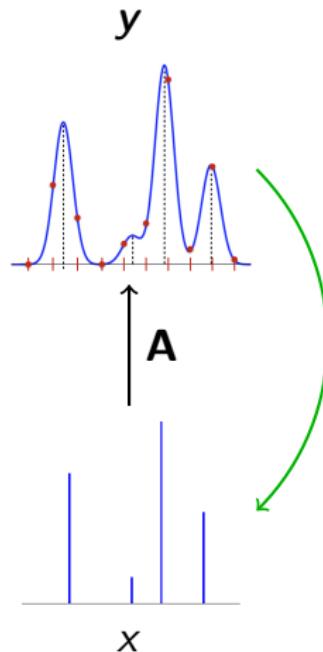

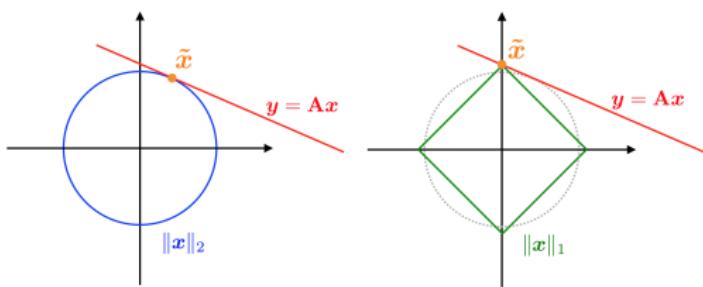

$$\mathbf{y} = y(\tau_i), \quad \tau_i = i\Delta/N \longrightarrow \tilde{x}_i$$

Sparse ℓ_1 deconvolution on a grid (LASSO)

$$\min_{\mathbf{c} \in \mathbb{R}^K} \frac{1}{2} \|\mathbf{y} - \mathbf{Ac}\|_2^2 + \lambda \|\mathbf{c}\|_1$$

$$\mathbf{y} = y(\tau_i), \quad \tau_i = i\Delta/N \longrightarrow \tilde{x}_i$$

Super-resolution of 1-D impulses off-the-grid

$$x = \sum_{k=1}^K c_k \delta_{t_k}, \quad c_k \geq 0, \quad t_k \geq 0$$

Minimization (convex regularization)

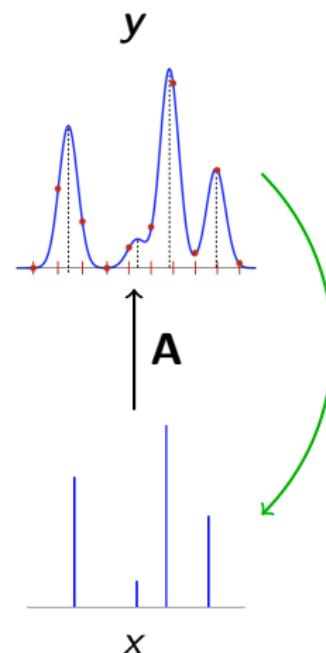

$$\arg \min_{\mu} \frac{1}{2} \|y - A\mu\|^2 + \lambda \|\mu\|_{TV}$$

Reference : (Candès, Fernandez-Granda, 2012)

$$d\mu(t) = f(t) dt$$

$$\|\mu\|_{TV} = \int |f| \quad \|x\|_{TV} = \|\mathbf{c}\|_1$$

Paradigm of the atomic decomposition

$$\mathbf{x} = \sum_{k=1}^K c_k \mathbf{a}_i, \quad c_i \geq 0, \quad \mathbf{a}_i \in \mathcal{A}$$

Atomic norm

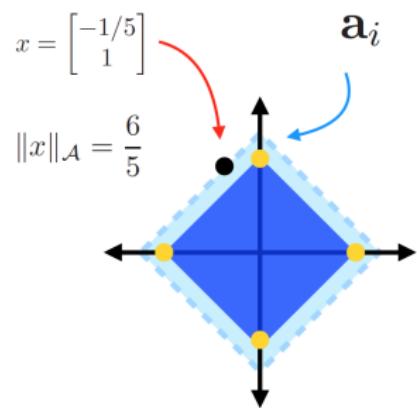

$$\|\mathbf{x}\|_{\mathcal{A}} = \inf \{t > 0 : \mathbf{x} \in t\text{conv}(\mathcal{A})\}$$

$$= \inf \left\{ \sum_{\mathbf{a} \in \mathcal{A}} c_{\mathbf{a}} : \mathbf{x} = \sum_{\mathbf{a} \in \mathcal{A}} c_{\mathbf{a}} \mathbf{a} \right\}$$

$$\mathcal{A} = \left\{ \begin{bmatrix} 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ -1 \end{bmatrix} \right\}$$

$$\|\mathbf{x}\|_{\mathcal{A}} = \|\mathbf{x}\|_1$$

(Chandrasekaran et al., 2010)

Super-resolution of 1-D impulses off-the-grid

$$\hat{\mathbf{x}} = \sum_{k=1}^K c_k \mathbf{a}(f_k), \quad c_k \geq 0, \quad \mathbf{a}(f_k) \in \mathcal{A}$$

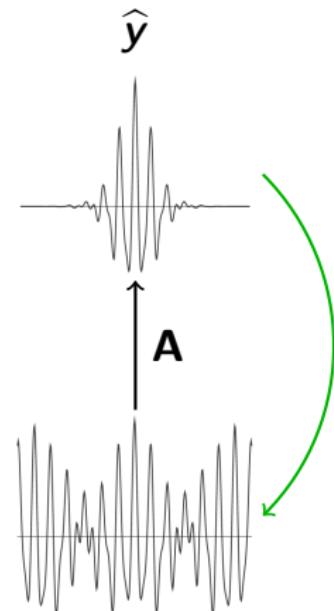

$$\mathcal{A} = \left\{ \mathbf{a}(f) \in \mathbb{C}^N \right\}, \quad [\mathbf{a}(f)]_i = e^{j2\pi f i}$$

$$\|\hat{\mathbf{x}}\|_{\mathcal{A}} = \inf \left\{ \sum_{\mathbf{a} \in \mathcal{A}} c_{\mathbf{a}} : \hat{\mathbf{x}} = \sum_{\mathbf{a} \in \mathcal{A}} c_{\mathbf{a}} \mathbf{a} \right\}$$

Minimization (convex regularization)

$$\arg \min_{\hat{\mathbf{x}}} \frac{1}{2} \|\hat{\mathbf{y}} - \mathbf{A}\hat{\mathbf{x}}\|^2 + \lambda \|\hat{\mathbf{x}}\|_{\mathcal{A}}$$

Reference : (Tang, Bhaskar, Recht et al., 2013)

$$(\mathcal{F}x)(\omega) = \sum_{k=1}^K c_k e^{j2\pi f_k \omega}$$

Super-resolution of 2-D impulses off-the-grid

$$\hat{\mathbf{x}} = \sum_{k=1}^K c_k \mathbf{a}(f_k), \quad f_k = (f_{k1}, f_{k2}) \in \mathbb{R}^2$$

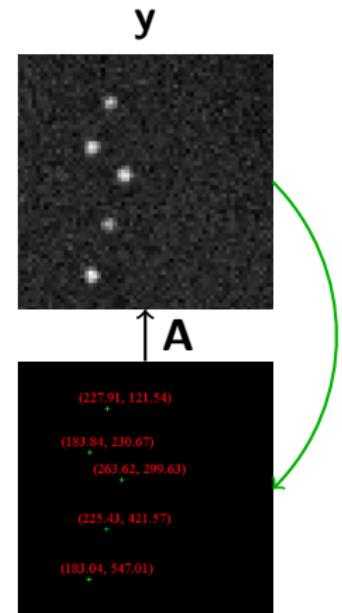

$$\mathcal{A}_{2D} = \left\{ \mathbf{a}(f) \in \mathbb{C}^{N \times N} \right\}, \quad \mathbf{a}(f_k) = \mathbf{a}(f_{k1}) \otimes \mathbf{a}(f_{k2})$$

$$\|\hat{\mathbf{x}}\|_{\mathcal{A}_{2D}} = \inf \left\{ \sum_{\mathbf{a} \in \mathcal{A}_{2D}} c_{\mathbf{a}} : \hat{\mathbf{x}} = \sum_{\mathbf{a} \in \mathcal{A}_{2D}} c_{\mathbf{a}} \mathbf{a} \right\}$$

Minimization (convex regularization)

$$\arg \min_{\hat{\mathbf{x}}} \frac{1}{2} \|\hat{\mathbf{y}} - \mathbf{A}\hat{\mathbf{x}}\|^2 + \lambda \|\hat{\mathbf{x}}\|_{\mathcal{A}_{2D}}$$

Reference : (Xu et al., 2013), (Chi and Chen, 2015)

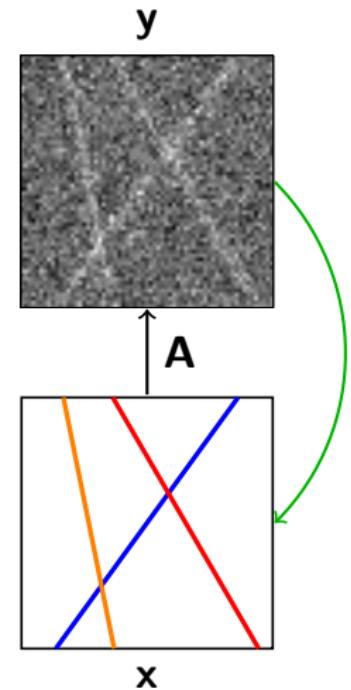

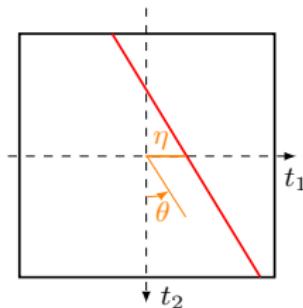

$$x = \sum_{k=1}^K c_k \delta_{(t_{k1}, t_{k2})}$$

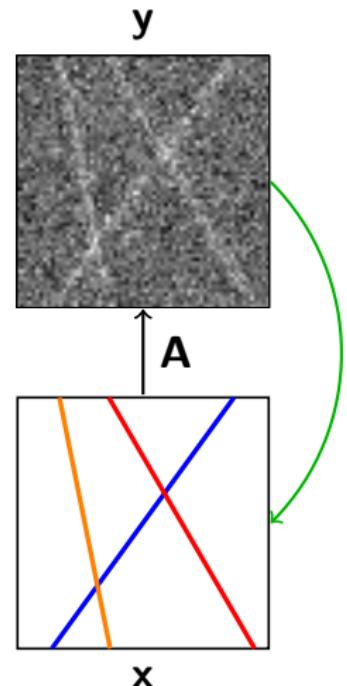

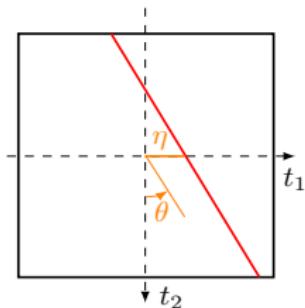

Super-resolution of 2-D lines off-the-grid

$$x^\sharp(t_1, t_2) = \sum_{k=1}^K \alpha_k \delta(\cos \theta_k (t_1 - \eta_k) + \sin \theta_k t_2)$$

Super-resolution of 2-D lines off-the-grid

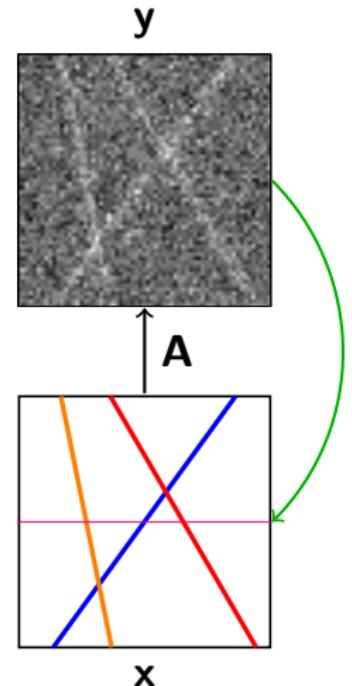

$$x^\sharp(t_1, t_2) = \sum_{k=1}^K \alpha_k \delta(\cos \theta_k (t_1 - \eta_k) + \sin \theta_k t_2)$$

- ✓ Atomic formulation in Fourier?

Modeling the blurred lines

$$x^\sharp : (t_1, t_2) \in \mathbb{P} \mapsto \sum_{k=1}^K \alpha_k \delta(\cos \theta_k(t_1 - \eta_k) + \sin \theta_k t_2)$$

$$\mathbf{b}^\sharp[n_1, n_2] = (x^\sharp * \phi)(n_1, n_2), \quad \phi(n_1, n_2) = \mathbf{g}[n_1] \mathbf{h}[n_2]$$

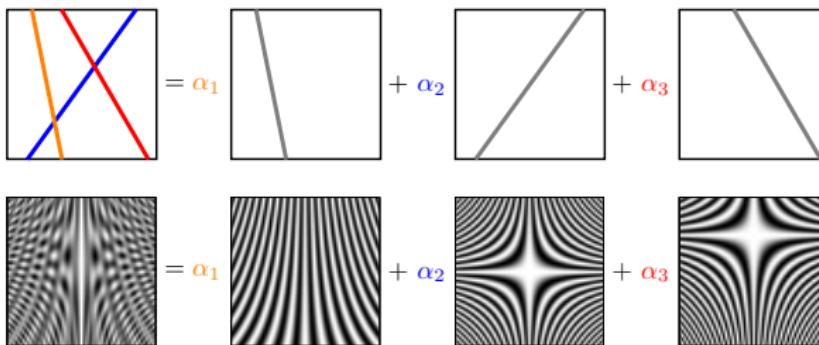

Modeling the blurred lines

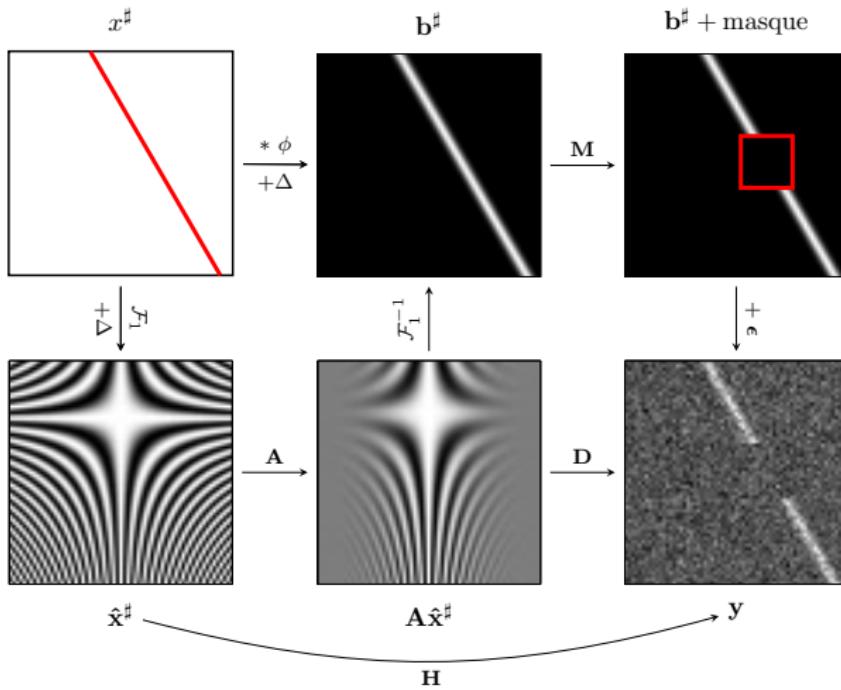

$$\widehat{\mathbf{x}}^\sharp[m, n_2] = (\mathcal{F}_1 x^\sharp)[m, n_2] = \sum_{k=1}^K c_k e^{j2\pi \left(\frac{\tan \theta_k}{W} n_2 + \frac{\eta_k}{W} \right) m}$$

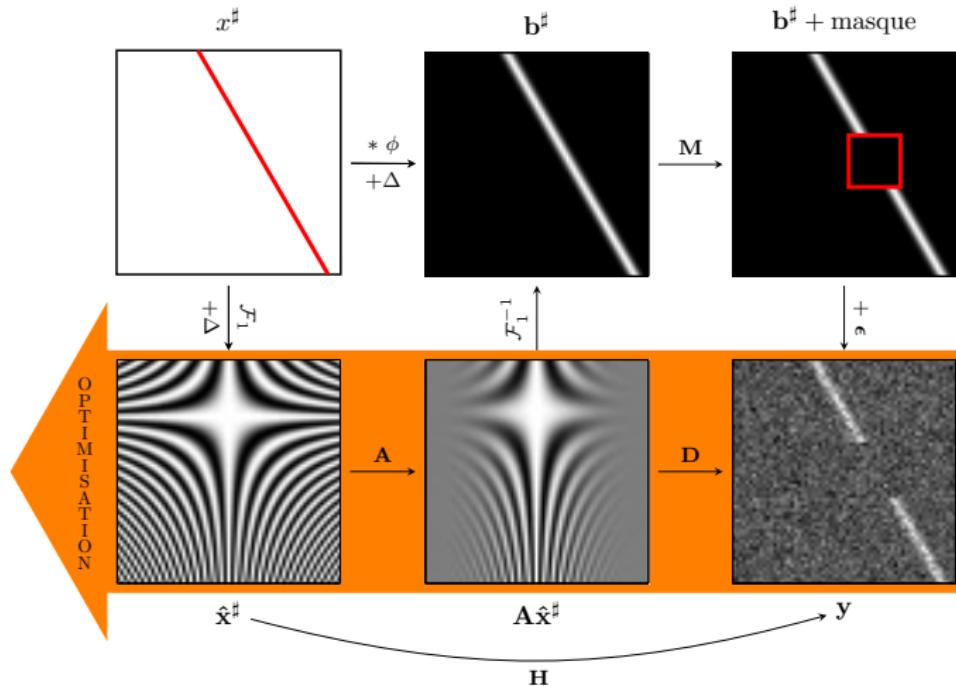

$$c_k = \frac{\alpha_k}{\cos \theta_k} \geq 0$$

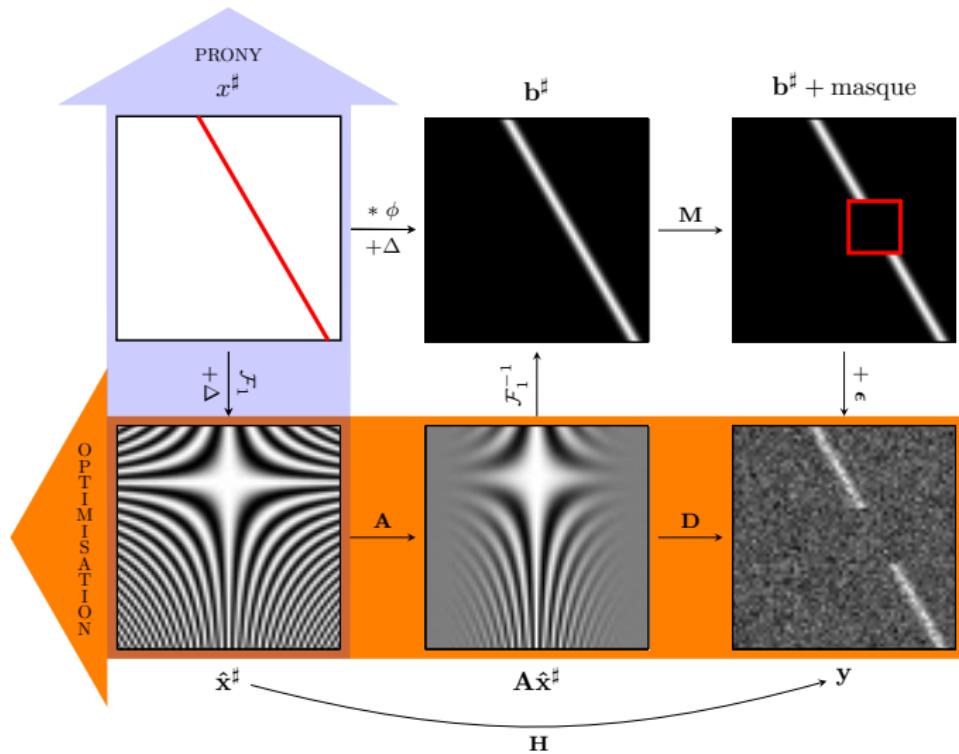

$$\widehat{\mathbf{b}}^\sharp[m, :] = (\widehat{\mathbf{g}}[m] \widehat{\mathbf{x}}^\sharp[m, :]) * \mathbf{h} \rightarrow \mathbf{A} \widehat{\mathbf{x}}^\sharp = \widehat{\mathbf{b}}^\sharp$$

Reconstruction steps

Atomic decomposition of columns and rows

$$\widehat{\mathbf{x}}^\sharp[\underline{m}, \underline{n}_2] = \sum_{k=1}^K c_k e^{j2\pi \left(\frac{\tan \theta_k}{W} \underline{n}_2 + \frac{\eta_k}{W} \right) \underline{m}}, \quad \underline{m} = -M, \dots, M$$

$$\widehat{\mathbf{x}}^\sharp[\underline{m}, \underline{n}_2] = \sum_{k=1}^K c_k e^{j2\pi \left(\frac{\tan \theta_k}{W} \underline{m} \right) \underline{n}_2 + \frac{2\pi \eta_k \underline{m}}{W}}, \quad \underline{n}_2 = 0, \dots, H-1$$

① $I_{n_2}^\sharp = \sum_{k=1}^K c_k \mathbf{a}(f_{n_2, k}, [0])$ (columns of $\widehat{\mathbf{x}}$, without phase)

② $t_m^\sharp = \sum_{k=1}^K c_k \mathbf{a}(f_{m, k}, [\phi_{m, k}])^\top$ (rows of $\widehat{\mathbf{x}}$, with phase)

$$[\mathbf{a}(f, \phi)]_i = e^{j(2\pi f i + \phi)} \in \mathcal{A}$$

Caratheodory theorem

Theorem (Caratheodory, 1907)

A vector $\mathbf{z} = (z_{N-1}^*, \dots, z_1^*, z_0, z_1, \dots, z_{N-1})$, with $z_0 \in \mathbb{R}$, is a positive combination of $K \leq N$ atoms $\mathbf{a}(f_k, \boxed{0})$ if and only if $\mathbf{T}_N(\mathbf{z}_+) \succcurlyeq 0$ and is of rank K , where $\mathbf{z}_+ = (z_0, \dots, z_{N-1})$ and

$$\mathbf{T}_N : \mathbf{z}_+ = (z_0, \dots, z_{N-1}) \mapsto \begin{pmatrix} z_0 & z_1^* & \cdots & z_{N-1}^* \\ z_1 & z_0 & \cdots & z_{N-2}^* \\ \vdots & \vdots & \ddots & \vdots \\ z_{N-1} & z_{N-2} & \cdots & z_0 \end{pmatrix}.$$

Moreover, this decomposition is **unique** if $K < N$.

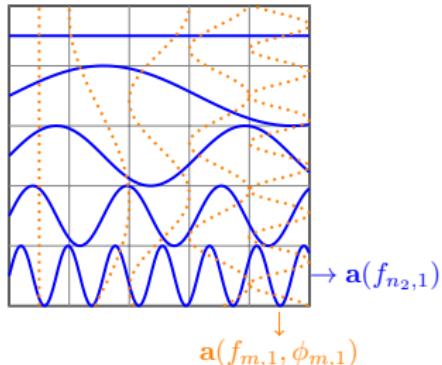

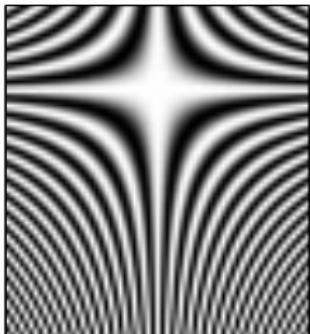

Atomic decomposition of one line ($K = 1$)

$$\hat{\mathbf{x}}^\sharp[m, n_2] = c_1 e^{j2\pi \left(\frac{\tan \theta_1}{W} n_2 + \frac{\eta_1}{W} \right) m} = c_1 e^{j2\pi ((f_1 - f_0)n_2 + f_0)m}$$

with $f_0 = -\eta_1/W$ and $f_1 = (\tan \theta_1 - \eta_1)/W$.

- ① $I_{n_2}^\sharp = c_1 \mathbf{a}(f_{n_2,1}, 0)$ (one atom without phase)
- ② $t_m^\sharp = c_1 \mathbf{a}(f_{m,1}, \phi_{m,1})^T$ (one atom with phase)

Atomic characterization of one line ($K = 1$)

Characterization of one sampled line in Fourier

A matrix $\hat{\mathbf{x}}$ is of the form $\hat{\mathbf{x}}[m, n] = c_1 e^{j2\pi((f_1 - f_0)n + f_0)m}$ if and only if the columns I_n and rows t_m of $\hat{\mathbf{x}}$ are such that $\mathbf{T}_M(I_n) \succcurlyeq 0$ and of rank 1, $\mathbf{P}_1(t_m)$ is of rank 1 and $\hat{\mathbf{x}}[0, n] = \hat{\mathbf{x}}[0, 0]$ for all m and n .

$$\underbrace{\begin{pmatrix} z_0 & z_1^* & \cdots & z_{N-1}^* \\ z_1 & z_0 & \cdots & z_{N-2}^* \\ \vdots & \vdots & \ddots & \vdots \\ z_{N-1} & z_{N-2} & \cdots & z_0 \end{pmatrix}}_{=\mathbf{T}_N(z)} \quad \underbrace{\begin{pmatrix} z_K & z_{K-1} & \cdots & z_0 \\ z_{K+1} & z_K & \cdots & z_1 \\ \vdots & \vdots & \ddots & \vdots \\ z_{N-1} & z_{N-2} & \cdots & z_{N-K-1} \end{pmatrix}}_{=\mathbf{P}_K(z)}.$$

Atomic characterization of one line ($K = 1$)

Characterization of one sampled line in Fourier

A matrix $\widehat{\mathbf{x}}$ is of the form $\widehat{\mathbf{x}}[m, n] = c_1 e^{j2\pi((f_1 - f_0)n + f_0)m}$ if and only if the columns I_n and rows t_m of $\widehat{\mathbf{x}}$ are such that $\mathbf{T}_M(I_n) \succcurlyeq 0$ and of rank 1, $\mathbf{P}_1(t_m)$ is of rank 1 and $\widehat{\mathbf{x}}[0, n] = \widehat{\mathbf{x}}[0, 0]$ for all m and n .

Convex relaxation: since $\mathbf{T}_M(I_{n_2}) = \mathbf{V}_{n_2} \text{diag}(c_1, \dots, c_K) \mathbf{V}_{n_2}^*$ with the Vandermonde matrix $\mathbf{V}_{n_2} = (\mathbf{a}(f_{n_2,1}), \dots, \mathbf{a}(f_{n_2,K}))$, we get:

$$\|\mathbf{T}_M(I_{n_2})\|_* \propto \|I_{n_2}\|_{\mathcal{A}}$$

Atomic norms computation

$$\textcircled{1} \quad I_{n_2}^\# = \sum_{k=1}^K c_k a(f_{n_2, k}, [0]) \Leftrightarrow \mathbf{T}_{M+1}(I_{n_2}^\#) \succcurlyeq 0 + \text{ of rank } K$$

Atomic norm without phase (Caratheodory, 1907)

Since $K < M$ the decomposition is **unique** then

$$\|I_{n_2}^\#\|_{\mathcal{A}} = \sum_{k=1}^K c_k = \widehat{\mathbf{x}}^\#[0, n_2] = c^*$$

$$\textcircled{2} \quad t_m^\# = \sum_{k=1}^K c_k a(f_{m, k}, [\phi_{m, k}])^\top$$

Atomic norm with phase (Tang et al., 2013)

$$\|\mathbf{t}_m^\#\|_{\mathcal{A}} = \inf_{\mathbf{q} \in \mathbb{C}^H, t \in \mathbb{R}} \left\{ \frac{1}{2} \text{Tr}(\mathbf{T}_N(\mathbf{q})) + \frac{1}{2} t : \begin{pmatrix} \mathbf{T}_N(\mathbf{q}) & \mathbf{t}_m^\# \\ \mathbf{t}_m^{\#*} & t \end{pmatrix} \succeq 0 \right\}$$

Atomic norms computation

$$\textcircled{1} \quad I_{n_2}^\# = \sum_{k=1}^K c_k a(f_{n_2,k}, \boxed{0}) \Leftrightarrow \mathbf{T}_{M+1}(I_{n_2}^\#) \succcurlyeq 0 + \text{ of rank } K$$

Atomic norm without phase (Caratheodory, 1907)

Since $K < M$ the decomposition is **unique** then

$$\| I_{n_2}^\# \|_{\mathcal{A}} = \sum_{k=1}^K c_k = \widehat{\mathbf{x}}^\# [0, n_2] = c^*$$

$$\textcircled{2} \quad t_m^\# = \sum_{k=1}^K c_k a(f_{m,k}, \boxed{\phi_{m,k}})^\top$$

Atomic norm with phase

$$\| t_m^\# \|_{\mathcal{A}} = \min_{\mathbf{q} \in \mathbb{C}^H} \left\{ q_0 : \underbrace{\begin{pmatrix} \mathbf{T}_N(\mathbf{q}) & t_m^\# \\ t_m^\# & q_0 \end{pmatrix}}_{\mathbf{T}'_N(t_m^\#, \mathbf{q})} \succcurlyeq 0 \right\} \equiv \underbrace{\text{SDP}(t_m^\#)}_{\mathbf{q}_m[0]} \leq c^*$$

Convex optimization problem

Proposition (Convex minimization)

$$\tilde{\mathbf{x}} \in \arg \min_{\hat{\mathbf{x}}, \mathbf{q} \in \mathcal{X} \times \mathcal{Q}} \frac{1}{2} \|\mathbf{A}\hat{\mathbf{x}} - \hat{\mathbf{y}}\|^2 ,$$

under constraints

$$\begin{cases} \forall n_2 = 0, \dots, H-1, \forall m = 1, \dots, M, \\ \hat{\mathbf{x}}[0, n_2] = \hat{\mathbf{x}}[0, 0] \leq c, \\ \mathbf{q}[m, 0] \leq c, \\ \mathbf{T}'_H(\hat{\mathbf{x}}[m, :], \mathbf{q}[m, :]) \geq 0, \\ \mathbf{T}_{M+1}(\hat{\mathbf{x}}[:, n_2]) \geq 0. \end{cases}$$

Convex optimization problem

Conclusion

- ✓ New method for the super-resolution of 2-D lines, with dedicated 1-D atomic norms penalities enforcing sparsity
- ✓ Penalize in both directions can lead to the exact solution
- ✗ No theoretical guarantees about separation conditions and statistical analysis for recovering the exact solution
- ✓ Solving the convex optimization problem by a primal-dual splitting algorithm
- ✗ Slow convergence : for each iteration perform SVD onto all the Toeplitz matrices made from rows and columns
- ✓ Extraction of the line parameters combining spectral estimation on rows/columns achieves subpixel accuracy

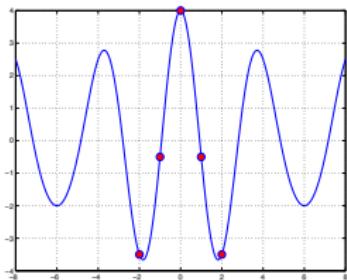

Questions?

Thank you for your attention

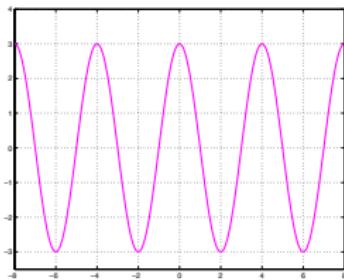

Frequencies extraction from columns and rows

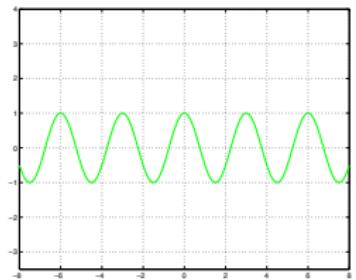

- ① $I_{n_2}^\sharp = \sum_{k=1}^K c_k a(f_{n_2,k}, 0)$ (columns of \hat{x} , without phase)
- ② $t_m^\sharp = \sum_{k=1}^K c_k a(f_{m,k}, \phi_{m,k})^\top$ (rows de \hat{x} , with phase)

- $$\begin{pmatrix} e^{jM\omega_1} & \dots & e^{jM\omega_K} \\ \vdots & \ddots & \vdots \\ e^{-jM\omega_1} & \dots & e^{-jM\omega_K} \end{pmatrix} \begin{pmatrix} \rho_1 \\ \vdots \\ \rho_K \end{pmatrix} = \begin{pmatrix} x_{-M} \\ \vdots \\ x_M \end{pmatrix} \Leftrightarrow \mathbf{U}\boldsymbol{\rho} = \mathbf{x}$$

Least-square method :

$$\mathbf{U}^H \mathbf{U} \boldsymbol{\rho} = \mathbf{U}^H \mathbf{x} \Leftrightarrow \boldsymbol{\rho} = (\mathbf{U}^H \mathbf{U})^{-1} \mathbf{U}^H \mathbf{x}$$
